# Set theory

---

A set is an unordered collection of objects, called elements or members of the set. A set is said to contain its elements. We write  $a \in A$  to denote that  $a$  is an element of the set  $A$ . The notation  $a \notin A$  denotes that  $a$  is not an element of the set  $A$ .

**EXAMPLE 1** The set  $V$  of all vowels in the English alphabet can be written as  $V = \{a, e, i, o, u\}$ .

**EXAMPLE 2** The set  $O$  of odd positive integers less than 10 can be expressed by  $O = \{1, 3, 5, 7, 9\}$ .

# Set theory

---

$\mathbb{N} = \{0, 1, 2, 3, \dots\}$ , the set of natural numbers

$\mathbb{Z} = \{\dots, -2, -1, 0, 1, 2, \dots\}$ , the set of integers

$\mathbb{Z}^+ = \{1, 2, 3, \dots\}$ , the set of positive integers

$\mathbb{Q} = \{p/q \mid p \in \mathbb{Z}, q \in \mathbb{Z}, \text{ and } q \neq 0\}$ , the set of rational numbers

$\mathbb{R}$ , the set of real numbers

$\mathbb{R}^+$ , the set of positive real numbers

$\mathbb{C}$ , the set of complex numbers.

# Set theory

---

Two sets are equal if and only if they have the same elements. Therefore, if  $A$  and  $B$  are sets, then  $A$  and  $B$  are equal if and only if  $\forall x(x \in A \leftrightarrow x \in B)$ . We write  $A = B$  if  $A$  and  $B$  are equal sets.

The sets  $\{1, 3, 5\}$  and  $\{3, 5, 1\}$  are equal, because they have the same elements. Note that the order in which the elements of a set are listed does not matter.

**THE EMPTY SET** There is a special set that has no elements. This set is called the empty set, or null set, and is denoted by  $\emptyset$ . The empty set can also be denoted by  $\{ \}$ .

# Set theory

---

The set  $A$  is a subset of  $B$  if and only if every element of  $A$  is also an element of  $B$ . We use the notation  $A \subseteq B$  to indicate that  $A$  is a subset of the set  $B$ .

**Note** that to show that  $A$  is not a subset of  $B$  we need only find one element  $x \in A$  with  $x \notin B$ . Such an  $x$  is a counterexample to the claim that  $x \in A$  implies  $x \in B$ .

The set of all odd positive integers less than 10 is a subset of the set of all positive integers less than 10, the set of rational numbers is a subset of the set of real numbers, the set of all computer science majors at your school is a subset of the set of all students at your school, and the set of all people

# Set theory

---

The set  $A$  is a **subset** of  $B$  if and only if every element of  $A$  is also an element of  $B$ . We use the notation  $A \subseteq B$  to indicate that  $A$  is a subset of the set  $B$ .

**Note** that to show that  $A$  is not a subset of  $B$  we need only find one element  $x \in A$  with  $x \notin B$ . Such an  $x$  is a counterexample to the claim that  $x \in A$  implies  $x \in B$ .

The set of all odd positive integers less than 10 is a subset of the set of all positive integers less than 10, the set of rational numbers is a subset of the set of real numbers, the set of all computer science majors at your school is a subset of the set of all students at your school, and the set of all people

# Set theory

---

For every set  $S$ , (i)  $\emptyset \subseteq S$  and (ii)  $S \subseteq S$ .

Let  $S$  be a set. If there are exactly  $n$  distinct elements in  $S$  where  $n$  is a nonnegative integer, we say that  $S$  is a finite set and that  $n$  is the cardinality of  $S$ . The **cardinality** of  $S$  is denoted by  $|S|$ .

Given a set  $S$ , the power set of  $S$  is the set of all subsets of the set  $S$ . The **power set** of  $S$  is denoted by  $P(S)$ .

**What is the power set of the set  $\{0, 1, 2\}$ ?**

**Solution:** The power set  $P(\{0, 1, 2\})$  is the set of all subsets of  $\{0, 1, 2\}$ . Hence,  $P(\{0, 1, 2\}) = \{\emptyset, \{0\}, \{1\}, \{2\}, \{0, 1\}, \{0, 2\}, \{1, 2\}, \{0, 1, 2\}\}$ . Note that the empty set and the set itself are members of this set of subsets.

# Set operations

---

## Union

Let  $A$  and  $B$  be sets. The union of the sets  $A$  and  $B$ , denoted by  $A \cup B$ , is the set that contains those elements that are either in  $A$  or in  $B$ , or in both.

$$A \cup B = \{x \mid x \in A \vee x \in B\}.$$

The union of the sets  $\{1, 3, 5\}$  and  $\{1, 2, 3\}$  is the set  $\{1, 2, 3, 5\}$ ; that is,  $\{1, 3, 5\} \cup \{1, 2, 3\} = \{1, 2, 3, 5\}$ .

## Intersection

Let  $A$  and  $B$  be sets. The intersection of the sets  $A$  and  $B$ , denoted by  $A \cap B$ , is the set containing those elements in both  $A$  and  $B$ .

$$A \cap B = \{x \mid x \in A \wedge x \in B\}.$$

The intersection of the sets  $\{1, 3, 5\}$  and  $\{1, 2, 3\}$  is the set  $\{1, 3\}$ ; that is,  $\{1, 3, 5\} \cap \{1, 2, 3\} = \{1, 3\}$ .

# Set operations

$A \cup B$  is shaded.

$A \cap B$  is shaded.

# Set operations

Let  $A$  and  $B$  be sets. The **difference** of  $A$  and  $B$ , denoted by  $A - B$ , is the set containing those elements that are in  $A$  but not in  $B$ . The difference of  $A$  and  $B$  is also called the complement of  $B$  with respect to  $A$ .

$$A - B = \{x \mid x \in A \wedge x \notin B\}$$

The difference of  $\{1, 3, 5\}$  and  $\{1, 2, 3\}$  is the set  $\{5\}$ ; that is,  $\{1, 3, 5\} - \{1, 2, 3\} = \{5\}$ . This is different from the difference of  $\{1, 2, 3\}$  and  $\{1, 3, 5\}$ , which is the set  $\{2\}$ .

$A - B$  is shaded.

$\bar{A}$  is shaded.

**Note:** The difference of sets  $A$  and  $B$  is sometimes denoted by  $A \setminus B$ .

# Set operations

---

Let  $U$  be the universal set. The complement of the set  $A$ , denoted by  $A^c$ , is the complement of  $A$  with respect to  $U$ . Therefore, the **complement of the set  $A$**  is  $U - A$ .

An element belongs to  $A^c$  if and only if  $x \notin A$ . This tells us that  $A^c = \{x \in U \mid x \notin A\}$ .

Let  $A = \{a, e, i, o, u\}$  (where the universal set is the set of letters of the English alphabet). Then  $A^c = \{b, c, d, f, g, h, j, k, l, m, n, p, q, r, s, t, v, w, x, y, z\}$ .

# Set identities

<i>Identity</i>	<i>Name</i>
$A \cap U = A$ $A \cup \emptyset = A$	Identity laws
$A \cup U = U$ $A \cap \emptyset = \emptyset$	Domination laws
$A \cup A = A$ $A \cap A = A$	Idempotent laws
$\overline{(\overline{A})} = A$	Complementation law
$A \cup B = B \cup A$ $A \cap B = B \cap A$	Commutative laws
$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$ $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$	Associative laws
$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$ $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$	Distributive laws
$\overline{A \cap B} = \overline{A} \cup \overline{B}$ $\overline{A \cup B} = \overline{A} \cap \overline{B}$	De Morgan's laws
$A \cup (A \cap B) = A$ $A \cap (A \cup B) = A$	Absorption laws
$A \cup \overline{A} = U$ $A \cap \overline{A} = \emptyset$	Complement laws

# Set identities

Use set builder notation and logical equivalences to establish the first De Morgan law  $\overline{A \cap B} = \overline{A} \cup \overline{B}$ .

We can prove this identity with the following steps.

$$\begin{aligned}\overline{A \cap B} &= \{x \mid x \notin A \cap B\} && \text{by definition of complement} \\ &= \{x \mid \neg(x \in (A \cap B))\} && \text{by definition of does not belong symbol} \\ &= \{x \mid \neg(x \in A \wedge x \in B)\} && \text{by definition of intersection} \\ &= \{x \mid \neg(x \in A) \vee \neg(x \in B)\} && \text{by the first De Morgan law for logical equivalences} \\ &= \{x \mid x \notin A \vee x \notin B\} && \text{by definition of does not belong symbol} \\ &= \{x \mid x \in \overline{A} \vee x \in \overline{B}\} && \text{by definition of complement} \\ &= \{x \mid x \in \overline{A} \cup \overline{B}\} && \text{by definition of union} \\ &= \overline{A} \cup \overline{B} && \text{by meaning of set builder notation}\end{aligned}$$

# Cartesian product

---

The ordered  $n$ -tuple  $(a_1, a_2, \dots, a_n)$  is the ordered collection that has  $a_1$  as its first element,  $a_2$  as its second element, ..., and  $a_n$  as its  $n$ th element.

- ❖ We say that two ordered  $n$ -tuples are equal if and only if each corresponding pair of their elements is equal.
- ❖ In other words,  $(a_1, a_2, \dots, a_n) = (b_1, b_2, \dots, b_n)$  if and only if  $a_i = b_i$ , for  $i = 1, 2, \dots, n$ . In particular, ordered 2-tuples are called ordered pairs. The ordered pairs  $(a, b)$  and  $(c, d)$  are equal if and only if  $a = c$  and  $b = d$ .
- ❖ **Note** that  $(a, b)$  and  $(b, a)$  are not equal unless  $a = b$ .

# Cartesian product

---

Let  $A$  and  $B$  be sets. The Cartesian product of  $A$  and  $B$ , denoted by  $A \times B$ , is the set of all ordered pairs  $(a, b)$ , where  $a \in A$  and  $b \in B$ . Hence,  $A \times B = \{(a, b) \mid a \in A \wedge b \in B\}$ .

What is the Cartesian product of  $A = \{1, 2\}$  and  $B = \{a, b, c\}$ ?

**Solution:** The Cartesian product  $A \times B$  is  $A \times B = \{(1, a), (1, b), (1, c), (2, a), (2, b), (2, c)\}$ .

# Cartesian product

---

Let  $A$  and  $B$  be sets. The Cartesian product of  $A$  and  $B$ , denoted by  $A \times B$ , is the set of all ordered pairs  $(a, b)$ , where  $a \in A$  and  $b \in B$ . Hence,  $A \times B = \{(a, b) \mid a \in A \wedge b \in B\}$ .

What is the Cartesian product of  $A = \{1, 2\}$  and  $B = \{a, b, c\}$ ?

**Solution:** The Cartesian product  $A \times B$  is  $A \times B = \{(1, a), (1, b), (1, c), (2, a), (2, b), (2, c)\}$ .

$B \times A = \{(a, 1), (a, 2), (b, 1), (b, 2), (c, 1), (c, 2)\}$ .

This is not equal to  $A \times B$

# Cartesian product

---

The Cartesian product of the sets  $A_1, A_2, \dots, A_n$ , denoted by  $A_1 \times A_2 \times \dots \times A_n$ , is the set of ordered  $n$ -tuples  $(a_1, a_2, \dots, a_n)$ , where  $a_i$  belongs to  $A_i$  for  $i = 1, 2, \dots, n$ . In other words,  $A_1 \times A_2 \times \dots \times A_n = \{(a_1, a_2, \dots, a_n) \mid a_i \in A_i \text{ for } i = 1, 2, \dots, n\}$ .

# Relation

Let  $A$  and  $B$  be sets. A binary relation from  $A$  to  $B$  is a subset of  $A \times B$ .

We use the **notation**  $aRb$  to denote that  $(a, b) \in R$ . Moreover, when  $(a, b)$  belongs to  $R$ ,  $a$  is said to be related to  $b$  by  $R$ .

Let  $A = \{0, 1, 2\}$  and  $B = \{a, b\}$ . Then  $\{(0, a), (0, b), (1, a), (2, b)\}$  is a relation from  $A$  to  $B$ . This means, for instance, that  $0 R a$ , but that  $1 \not R b$ .

$R$	$a$	$b$
0	×	×
1	×	
2		×

# Relation

---

A relation on a set  $A$  is a relation from  $A$  to  $A$ .

Let  $A$  be the set  $\{1, 2, 3, 4\}$ . Which ordered pairs are in the relation  $R = \{(a, b) \mid a \text{ divides } b\}$ ?

**Solution:** Because  $(a, b)$  is in  $R$  if and only if  $a$  and  $b$  are positive integers not exceeding 4 such that  $a$  divides  $b$ , we see that  $R = \{(1, 1), (1, 2), (1, 3), (1, 4), (2, 2), (2, 4), (3, 3), (4, 4)\}$ .

# Relation properties

A relation  $R$  on a set  $A$  is called **reflexive** if  $(a, a) \in R$  for every element  $a \in A$ .

Consider the following relations on  $\{1, 2, 3, 4\}$ :

$$R_1 = \{(1, 1), (1, 2), (2, 1), (2, 2), (3, 4), (4, 1), (4, 4)\},$$

$$R_2 = \{(1, 1), (1, 2), (2, 1)\},$$

$$R_3 = \{(1, 1), (1, 2), (1, 4), (2, 1), (2, 2), (3, 3), (4, 1), (4, 4)\},$$

$$R_4 = \{(2, 1), (3, 1), (3, 2), (4, 1), (4, 2), (4, 3)\},$$

$$R_5 = \{(1, 1), (1, 2), (1, 3), (1, 4), (2, 2), (2, 3), (2, 4), (3, 3), (3, 4), (4, 4)\},$$

$$R_6 = \{(3, 4)\}.$$

Which of these relations are reflexive?

**Solution:** The relations  $R_3$  and  $R_5$  are reflexive because they both contain all pairs of the form  $(a, a)$ , namely,  $(1, 1)$ ,  $(2, 2)$ ,  $(3, 3)$ , and  $(4, 4)$ . The other relations are not reflexive because they do not contain all of these ordered pairs. In particular,  $R_1$ ,  $R_2$ ,  $R_4$ , and  $R_6$  are not reflexive because  $(3, 3)$  is not in any of these relations.

# Relation properties

A relation  $R$  on a set  $A$  is called **symmetric** if  $(b, a) \in R$  whenever  $(a, b) \in R$ , for all  $a, b \in A$ . A relation  $R$  on a set  $A$  such that for all  $a, b \in A$ , if  $(a, b) \in R$  and  $(b, a) \in R$ , then  $a = b$  is called **antisymmetric**.

Consider these relations on the set of integers:

$$R_1 = \{(a, b) \mid a \leq b\},$$

$$R_2 = \{(a, b) \mid a > b\},$$

$$R_3 = \{(a, b) \mid a = b \text{ or } a = -b\},$$

$$R_4 = \{(a, b) \mid a = b\},$$

$$R_5 = \{(a, b) \mid a = b + 1\},$$

$$R_6 = \{(a, b) \mid a + b \leq 3\}.$$

Which of the relations from are symmetric and which are antisymmetric?

The relations  $R_3$ ,  $R_4$ , and  $R_6$  are symmetric.

$R_1$ ,  $R_2$ ,  $R_5$ , and  $R_6$  are antisymmetric.

# Relation properties

---

A relation  $R$  on a set  $A$  is called **transitive** if whenever  $(a, b) \in R$  and  $(b, c) \in R$ , then  $(a, c) \in R$ , for all  $a, b, c \in A$ .

Which of the relations in Example of reflexive property are transitive?

**Solution:**  $R_4$ ,  $R_5$ , and  $R_6$  are transitive.

23

A relation on a set  $A$  is called an **equivalence relation** if it is reflexive, symmetric, and transitive.

# Relation properties

---

A relation  $R$  on a set  $A$  is called **transitive** if whenever  $(a, b) \in R$  and  $(b, c) \in R$ , then  $(a, c) \in R$ , for all  $a, b, c \in A$ .

Which of the relations in Example of reflexive property are transitive?

**Solution:**  $R_4$ ,  $R_5$ , and  $R_6$  are transitive.

24

A relation on a set  $A$  is called an **equivalence relation** if it is reflexive, symmetric, and transitive.

# Relation properties

---

Let  $R$  be the relation on the set of real numbers such that  $aRb$  if and only if  $a - b$  is an integer. Is  $R$  an equivalence relation?

## Solution:

- ✓ Because  $a - a = 0$  is an integer for all real numbers  $a$ ,  $aRa$  for all real numbers  $a$ . Hence,  $R$  is reflexive.
- ✓ Now suppose that  $aRb$ . Then  $a - b$  is an integer, so  $b - a$  is also an integer. Hence,  $bRa$ . It follows that  $R$  is symmetric.
- ✓ If  $aRb$  and  $bRc$ , then  $a - b$  and  $b - c$  are integers. Therefore,  $a - c = (a - b) + (b - c)$  is also an integer. Hence,  $aRc$ . Thus,  $R$  is transitive.
- ✓ Consequently,  $R$  is an **equivalence relation**.

# Function

Let  $A$  and  $B$  be nonempty sets. A **function  $f$  from  $A$  to  $B$**  is an assignment of exactly one element of  $B$  to each element of  $A$ . We write  $f(a) = b$  if  $b$  is the unique element of  $B$  assigned by the function  $f$  to the element  $a$  of  $A$ . If  $f$  is a function from  $A$  to  $B$ , we write  $f : A \rightarrow B$ .

If  $f$  is a function from  $A$  to  $B$ , we say that  $A$  is the **domain** of  $f$  and  $B$  is the **codomain** of  $f$ . If  $f(a) = b$ , we say that  **$b$  is the image of  $a$  and  $a$  is a preimage of  $b$** . The range, or image, of  $f$  is the set of all images of elements of  $A$ . Also, if  $f$  is a function from  $A$  to  $B$ , we say that  $f$  maps  $A$  to  $B$ .

26

# Function

A function  $f$  is said to be **one-to-one**, or an **injection**, if and only if  $f(a) = f(b)$  implies that  $a = b$  for all  $a$  and  $b$  in the domain of  $f$ . A function is said to be **injective** if it is one-to-one.

# Function

---

A function  $f$  from  $A$  to  $B$  is called **onto, or a surjection**, if and only if for every element  $b \in B$  there is an element  $a \in A$  with  $f(a) = b$ . A function  $f$  is called **surjective if it is onto**.

Let  $f$  be the function from  $\{a, b, c, d\}$  to  $\{1, 2, 3\}$  defined by  $f(a) = 3$ ,  $f(b) = 2$ ,  $f(c) = 1$ , and  $f(d) = 3$ . Is  $f$  an onto function?

**Solution:** Because all three elements of the codomain are images of elements in the domain, we see that  $f$  is onto.

**Note that** if the codomain were  $\{1, 2, 3, 4\}$ , then  $f$  would not be onto.

# Function

29

The function  $f$  is a one-to-one correspondence, or a bijection, if it **is both one-to-one and onto**. We also say that such a function is **bijective**.

# Function

Let  $f$  be a one-to-one correspondence from the set  $A$  to the set  $B$ . The inverse function of  $f$  is the function that assigns to an element  $b$  belonging to  $B$  the unique element  $a$  in  $A$  such that  $f(a) = b$ . The inverse function of  $f$  is denoted by  $f^{-1}$ . Hence,  $f^{-1}(b) = a$  when  $f(a) = b$ .

A one-to-one correspondence is called **invertible** because we can define an inverse of this function. A function is not invertible if it is not a one-to-one correspondence, because the inverse of such a function does not exist.

# Function

---

Let  $f : \mathbb{Z} \rightarrow \mathbb{Z}$  be such that  $f(x) = x + 1$ . Is  $f$  invertible, and if it is, what is its inverse?

**Solution:** The function  $f$  has an inverse because it is a one-to-one correspondence, as follows from Examples 10 and 14. To reverse the correspondence, suppose that  $y$  is the image of  $x$ , so that  $y = x + 1$ . Then  $x = y - 1$ . This means that  $y - 1$  is the unique element of  $\mathbb{Z}$  that is sent to  $y$  by  $f$ . Consequently,  $f^{-1}(y) = y - 1$ .

Let  $f$  be the function from  $\mathbb{R}$  to  $\mathbb{R}$  with  $f(x) = x^2$ . Is  $f$  invertible?

**Solution:** Because  $f(-2) = f(2) = 4$ ,  $f$  is not one-to-one. If an inverse function were defined, it would have to assign two elements to 4. Hence,  $f$  is not invertible.

(Note we can also show that  $f$  is not invertible because it is not onto.)

# Function

Let  $g$  be a function from the set  $A$  to the set  $B$  and let  $f$  be a function from the set  $B$  to the set  $C$ . The composition of the functions  $f$  and  $g$ , denoted for all  $a \in A$  by  $f \circ g$ , is defined by  $(f \circ g)(a) = f(g(a))$ .

❖ Let  $f$  and  $g$  be the functions from the set of integers to the set of integers defined by  $f(x) = 2x + 3$  and  $g(x) = 3x + 2$ . What is the composition of  $f$  and  $g$ ? What is the composition of  $g$  and  $f$ ?

❖ **Solution:** Both the compositions  $f \circ g$  and  $g \circ f$  are defined. Moreover,  $(f \circ g)(x) = f(g(x)) = f(3x + 2) = 2(3x + 2) + 3 = 6x + 7$  and  $(g \circ f)(x) = g(f(x)) = g(2x + 3) = 3(2x + 3) + 2 = 6x + 11$ .

# Thank you
